

Acoustic Testing

Acoustic testing allows house builders to demonstrate the level of acoustic performance within their properties. Testing allows you to comply with Building Regulations and perhaps more importantly, demonstrate to potential buyers that your properties are built in line with legislation and regulation, such as the Code for Sustainable Homes.

As with air pressure testing, acoustic tests measure the efficiency of each unit type on your development. To provide you with a rating only 10% of each unit type needs to be tested. If you are unsure as to how many unit types you have on your site, you should refer this to Building Control.

We offer a full consultation service through our national network of acoustic engineers. Once completed, you will receive a full report on your results including indications of any areas which need to be addressed.

Noise and Vibration Assessments

Noise and Vibration assessments often form conditions within the Planning Process resulting in the need to submit a detailed survey report to the Local Planning Authority. We offer a highly competitive and professional service to meet these requirements.

Our acoustic testing service includes the following features:

- Our service is fully accredited and is carried out by qualified and experienced acoustic testers.
- We provide national coverage and offer testing services on any type of residential unit.
- All clients will receive free advice and guidance on the best ways to achieve acoustic efficiency.
- Our rates are amongst the lowest available on the market and you could benefit from additional savings if you purchase our acoustic testing services alongside our other products.
- If purchased alongside our warranty, you can also benefit from a local site contact, who will be on hand to assist you with any issues you may have regarding our services.
