

# Residential & Commercial Air Pressure Testing

## Residential

Air pressure tests are the mandatory method by which house builders measure the air tightness of their developments. Testing shows how well properties will retain heat and in turn reduce carbon emissions, making them more efficient and cheaper to maintain.

How many units you need to test will be determined by the make-up of your development and the standards of construction you are building to. Using Accredited Construction Details for example will reduce the number of units you need to test. If you are unsure of how many units you need to test, you should refer this to your Building Control provider.

We have a national network of fully trained and accredited air pressure testers who can provide advice on how to achieve good results both prior to and during testing. Once the test is completed, you will receive a full report on your results.

Our air pressure testing service includes the following features:

- Our service is fully accredited and is carried out by qualified and experienced air pressure testers.
- We provide national coverage and offer testing services on any type of residential unit.
- All clients will receive free advice and guidance on the best ways to achieve air-tightness.
- Our rates are amongst the lowest available on the market.
- If purchased alongside our warranty, you can also benefit from a local site contact, who will be on hand to assist you with any issues you may have regarding our services.
